

BTH545 Workshop 5

Learning Outcomes

- Develop personas for various groups of users,
- Recognize important characteristics for personas,
- Develop a list of requirements based on personas.

Design

You are designing an application for the student information system described in the accompanying document.

This system has two categories of users: 1) Student and 2) Faculty. You should identify four different users which should include at least two types of students and two types of faculties. So that they represent the full range of requirements that the majority of users will have.

List the four users you identified. Develop personas for the users that you have identified as representative.

Reflection

The reflection should be written in a file called reflect.txt. Write explanations for the following design decisions you made. Do not give trivial answers but explore the topics in depth.

1. Explain how you identified the types of users for the student information system.
2. List, and briefly explain, the requirements implied by the stories in the problem description but not explicitly stated. Comment on how you incorporated each of these requirements into your persona.
3. List the requirements implied by the personas you developed with sufficient detail on each requirement so that it is comprehensible.
